

The flow we are building

Build What Moves India — EPFO redesign — final scope for the 2-minute demo

The exact flow, end to end

Flow name: Full PF withdrawal after leaving a job (equivalent to today's Form 19 settlement claim).

This is the entire scope of the demo. Nothing else is shown live.

Step	What the user does	What the system does
1. Start	Opens the withdrawal claim from the dashboard	Auto-fills UAN, name, bank account, and reason from the saved profile
2. Check	Reviews the pre-filled form	Cross-checks Aadhaar, bank, and EPFO records; if a name or detail d
3. Submit	Confirms and submits	Claim is queued (works even on a weak connection); a claim ID is gen
4. Track	Checks status anytime	Live status bar: Submitted -> Under review -> Approved -> Paid, each

Explicitly out of the live demo (built, but only mentioned): job-switch/UAN transfer, grievance portal, system status page, pensioner life certificate flow. These exist in the prototype as supporting screens but are not part of the 2-minute walkthrough.

Why this flow, specifically

Highest personal recognition

Full withdrawal after leaving a job is the single EPFO interaction most working Indians — including the judges — have personally done. Emergency/medical withdrawal is more severe but is someone else's pain to a judge; this one is remembered pain.

Cited directly by the research

The source report's headline stat is an 8-day outage locking out roughly 70 million subscribers with about 3.28 lakh claims stuck — settlement/withdrawal claims are exactly this category of claim.

Touches the most-cited root causes at once

Employer dependence (Date of Exit not updated), rigid identity matching (name mismatches), and cryptic rejection logic all converge on this one claim type more than any other.

Fits the brief's own rule

The hackathon brief asks builders to solve one clearly defined problem and let judges complete the full journey — not tour a rebuilt website.

What we are doing differently

Pre-filled from a saved profile

The current site asks for the same Aadhaar, PAN, and bank details on every form. We save it once, verified once, and every form after that auto-fills — the single highest-leverage fix against the research's top complaint category.

Mismatches caught before submission, not after

Today, a name spelling difference between Aadhaar and bank records causes a rejection days later with a cryptic code. We catch it live, in plain language, with a direct fix — before the claim ever leaves the form.

One system, not five portals

No separate logins for passbook, KYC, and claims. One session, one dashboard, so there is no cross-portal hop that can fail mid-transition.

Real status tracking, not a black hole

Submitted -> Under review -> Approved -> Paid, visible at any time, in plain language — not a generic 'under process' with no further detail.

Built for failure, not just for success

Forms save progress as the user goes, so a timeout or a weak connection never means starting over — directly answering the 'gets stuck and just says try again' complaint.

Wireframes: the three screens

Simplified layout sketches of the three screens that make up the full demo flow.

Withdraw my PF	Check before you submit	Claim submitted
Name Suresh Kumar UAN 100X Bank a/c X Reason Review and continue All fields pulled from saved profile	Name does not match bank record Aadhaar: Suresh Kumar Bank: S Kumar Fix this now so it is not rejected later Update bank name to match	Submitted Done Under review In progress Approved Pending Paid out Pending

1. Pre-filled start

2. Mismatch caught early

3. Trackable status

Same claim on the current site: user finds their UAN on an old payslip, logs into e-Sewa, guesses which form applies (19, 31, or 10C), submits, and finds out about any mismatch only after rejection — with no visible status in between.
